

Email Automation System

How to run everything from the Dashboard
(No technical knowledge needed - no code editing)

Simple step-by-step guide
For: Management
Date: August 2026

Everything is done from a web page in your browser.
You do not need to touch any code or file.

What is in this guide

This guide shows you how to run the email campaign using ONLY the Dashboard (a web page).
You will see six simple sections:

- PART 1 - Start the Dashboard (the only command you will ever type)
- PART 2 - Enter your email details (Settings)

- PART 3 - Add your leads list (Email List)
- PART 4 - Start the campaign (Actions)
- PART 5 - Watch results live
- PART 6 - Stop the campaign

PART 1 - Start the Dashboard

This is done only ONCE. After this, everything else happens in your browser.

Step 1.1

Find the project folder on your computer. It is called **EmailAutomation2026**.

Step 1.2

Open the folder, then open the **Scripts** folder inside it.

Step 1.3

In the address bar of the folder (top of the window), click once, type **cmd** and press Enter. A black window (Command Prompt) will open in that folder.

Step 1.4

Type this one line and press Enter:

```
python Scripts\DASHBOARD.py
```

Step 1.5

After a few seconds, your browser will open automatically with the Dashboard page. If it does not open, open your browser and type this address: **http://localhost:7070**

Important: Do not close the black window. The Dashboard runs inside it. Minimize it if needed.

PART 2 - Enter your email details (Settings)

This is the one-time setup. You only do this on the first day.

Step 2.1

On the Dashboard, click the **Settings** button on the left side (gear icon).

Step 2.2

Fill in these boxes (your IT team will give you the values):

Box	What to write
Sender Email	The email that sends the mails, e.g. pradeep@orbitavanyatech.com
Sender Password	The password for that email account
SMTP Server / Port	Outgoing mail server details (from your email provider)
IMAP Server / Port	Incoming mail server details (from your email provider)
Email Subject	The subject line of your email
Lead Excel File	The file with the leads (you can choose it with the Browse button)
Max Emails Per Run	How many emails per batch, e.g. 100
Daily Send Limit	Maximum emails per day, e.g. 500

Step 2.3

Click the green button **Save Settings**.

Good news: After you save once, the settings are remembered. Next time you start the Dashboard, everything is already filled in - you can skip this part.

PART 3 - Add your leads list (Email List)

Your leads (company names, CEO names, email addresses) must be in an Excel or CSV file.

Step 3.1

Click **Email List** on the left side of the Dashboard.

Step 3.2

Click the **Upload / Choose File** button and pick your leads file.

Step 3.3

The system will check the emails and show you how many are real and how many are fake.

Step 3.4

Click **Save** to add the valid leads to the campaign.

Tip: Do not use the same leads file twice - the system automatically skips people who were already emailed.

PART 4 - Start the campaign (Actions)

Step 4.1

Click **Actions** on the left side of the Dashboard.

Step 4.2

Click the **Start Campaign** button.

Step 4.3

The system will start in the background and begin sending emails one by one. You will see the live progress in the log on the same page.

Do not close the browser tab or the black window while the campaign is running.

PART 5 - Watch results live

While the campaign runs, you can check the results from the Dashboard:

Tab	What you can see
Overview	Total emails sent, opened, clicked, replied - at a glance
Live Events	Every open / click / visit as it happens, in real time
Leads	The full list with status: Sent, Opened, Replied, Bounced
Templates	Edit the email text and design (optional)

PART 6 - Stop the campaign

Step 6.1

Go to the **Actions** tab and click **Stop Campaign**.

Step 6.2

The sending stops. People who were already emailed will never be emailed again.

Step 6.3

If you want to stop everything completely, close the black window (the Dashboard) too.

If something looks wrong or an error appears on screen, tell your IT team and show them the message.
